CASE STUDY

Overview :

Android operating system is widely used due to its smart and rich applications. Our team of developers are acquainted in app development for Android phones and tablets. We transcend in giving Android application development services for business or consumer app demands.

Our professional windows mobile application developers are proficient in developing easy to use windows mobile applications. Possessing the knowledge of visual studio IDE (integrated development environment), .net compact framework and SQL server mobile edition, our developers deliver the best results.

Purpose :

This mobile application is only for private circulation and will be dispensed to the insurance advisors and sales staff handling the product line. This will enable the team to arrive at premium figures at press of a button.

Application :

We have developed a mobile based application for Android and iOS platforms which helps to calculate insurance policy premium under various options. The insurance policy is aimed at the property buyers availing home loans. This policy insures policy holder on his/ her liability towards the payment of EMI and loan amount, in an unfortunate event of death, including accidental benefit & critical illness Therefore the logic of premium calculation is based on various home loans values correlated with sum assured in the policy along with eligibility criteria, age, policy term and policy conditions. Back end Calculations and logic are complex in nature and the output screen needs to deliver precise and accurate premium values along with service taxes applicable. So the customer proceeds to disburse exact payments based on the result by the calculator app.
